Color Wheel

Color Wheel

- A color wheel (also referred to as a color circle) is a visual representation of colors arranged according to their chromatic relationship
- Begin a color wheel by positioning primary hues equidistant from one another, then create a bridge between primaries using secondary and tertiary colors

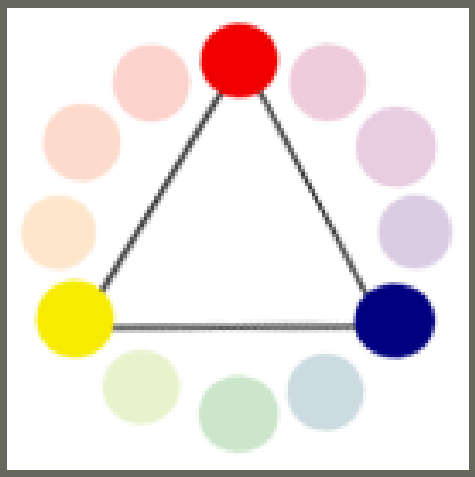

Color Wheel Example

Color Wheel – Primary Colors

- Colors at their basic essence
- Colors that cannot be created by mixing others
- Equal distance from each other on the color wheel
- All other colors are made from these

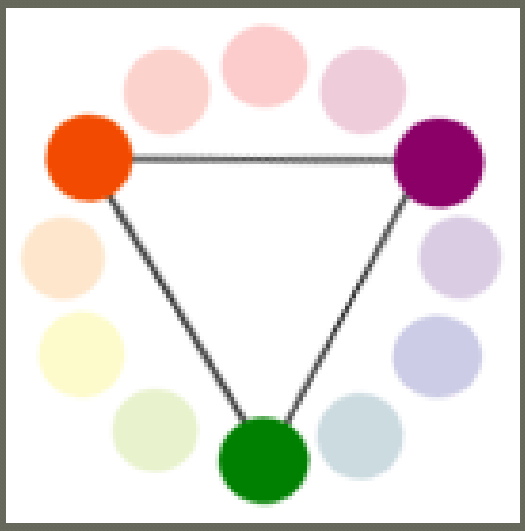

Color Wheel – Primary Colors

Color Wheel – Secondary Colors

- Colors achieved by a mixture of equal amounts of two primary colors
- Found halfway between the primary hues on the wheel

Color Wheel – Secondary Colors

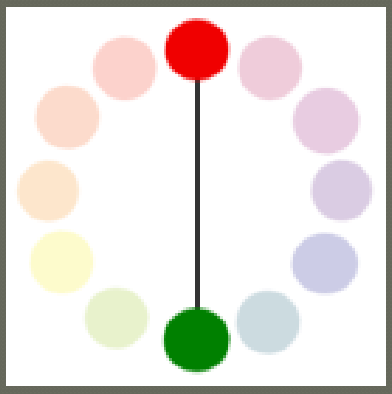

Color Wheel – Tertiary Colors

Colors achieved by a mixture of equal amounts of adjoining primary and secondary hues

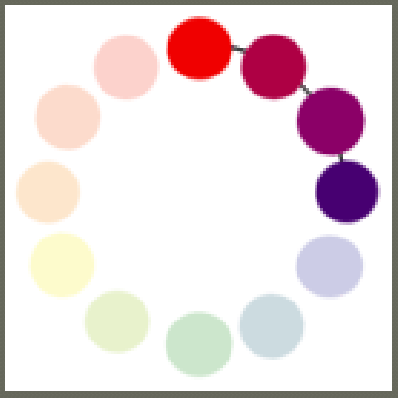

Color Wheel – Complementary Colors

Colors located opposite each other on a color wheel

Color Wheel – Analogous Colors

Colors located close together on a color wheel

Color Triangle

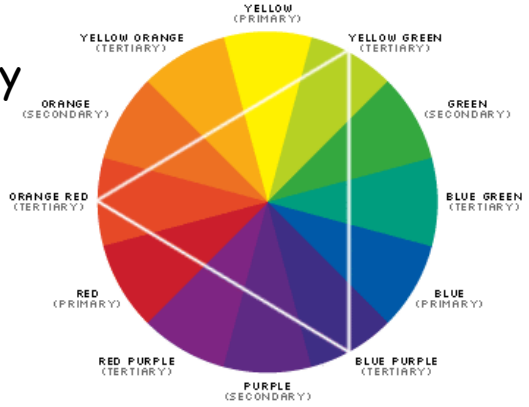

Color relationships may be displayed as a color triangle instead of a color wheel

Color Schemes

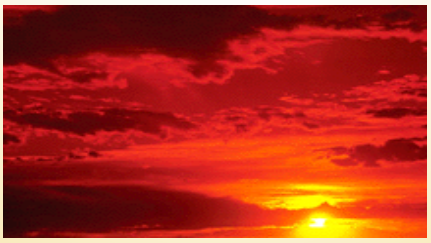

Color Schemes

- From using the color wheel it is possible to create a variety of color combinations called "color schemes".

WARM COLORS

- ❖Appear hot like the sun or like fire
- ❖The warm colors include red, orange, yellow
- ❖Give feelings of activity or cheerfulness
- ❖Appear to advance – they make a body look larger
- ❖Can give a nervous impression if overdone

COOL COLORS

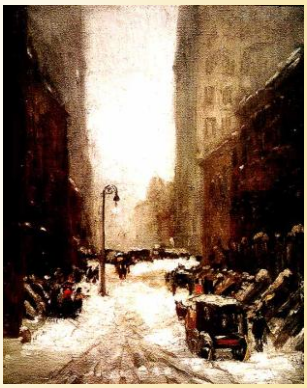

- ❖Remind us of water or sky
- ❖The cool colors include blue, green, purple
- ❖Give feelings of quietness or restfulness
- ❖Appear to recede and make a body look smaller
- ❖Can be depressing if overdone

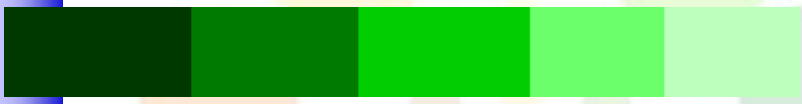

Neutrals

- Neutrals don't usually show up on the color wheel.
- Neutrals include black, white, gray, brown and beige.
- They are sometimes called "earth tones."
- There are a few different ways to make neutrals:
  - Blend black and white to make gray
  - Create brown by blending two complementary colors together or by blending all three primary colors together.

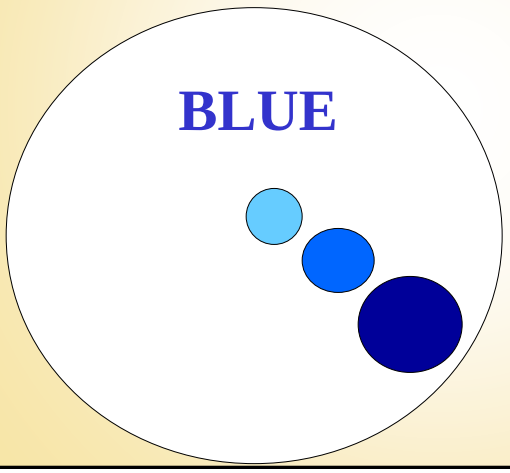

Monochromatic Colors

- A monochromatic scheme consists of different values (tints and shades) of a single color.
- An example of a monochrome color scheme could include any color mixed with white or black. The example above is a green ***monochromatic color scheme.***
  - A shade of green is made by mixing green and black.
  - A tint of green is made by mixing green and white.

MONOCHROMATIC COLOR SCHEME

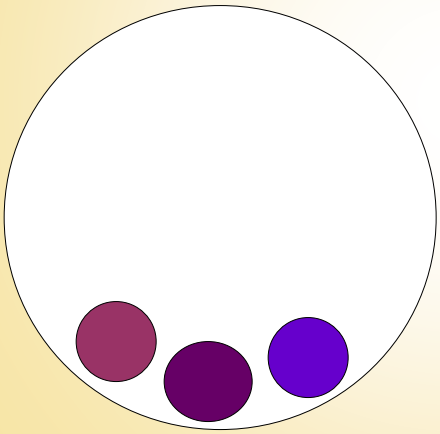

This is a one-color plan that uses different tints, shades and intensities of the color

ANALOGOUS COLOR SCHEME

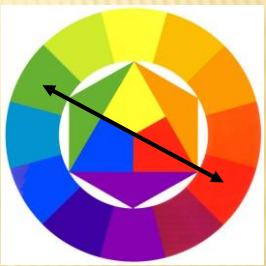

This color scheme uses related, or neighboring colors on the color wheel with varying values and intensities of the colors.

COMPLEMENTARY COLOR SCHEME

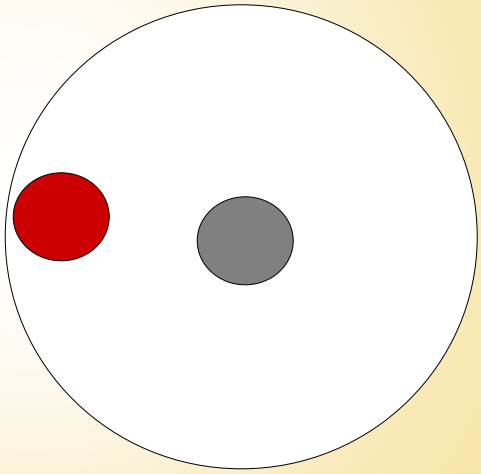

- Red and green are an example of complementary colors.
- The reddish-pink color of the flowers really stands out against the green background.

Accented Neutral Color Scheme

This color scheme combines white, black, gray or sometimes beige with a bright color accent.

ACCENTED NEUTRAL COLOR SCHEME
